THE ILLUSION OF CONTROL

Expectation vs Reality

✨ THE DREAM
THE MAESTRO

Sip coffee/play video games
while the agents ships

🚓 THE REALITY
THE BABYSITTER

“Can I run git status?”
“Can I rm the file I just
created?”
“Do you accept my plan to do
something simple?”

A kindergarten of hyperactive amnesiacs.

DAILY CONFESSIONS

I'm getting tired of telling them the same things...

"Can you write docs in ENGLISH?"

"PR is merged, rebase main and delete the branch."

"Your PR is failing CI tests, fix it until they pass!"

"Why are you using Gemini 2.5?!?"

That's worst that working with human being...

THE MENTAL MODEL

Your AI Agent is Like an Intern

Engine Architecture
Module & naming rules

Security & Style
Studio coding standards

Git & PR Workflow
Branching & commit policies

Updating Jira
So your producer is happy

Documenting
So your QA team is happy

Shaders & VFX
Render pipeline skills

Audio & Physics
Sound & collision toolkits

CI & Unit Tests
Test runners & verification

COGNITIVE FRICTION

The 90-Second Latency Trap

 < 30 SECONDS

FLOW STATE

> 90 SECONDS

CONTEXT SWITCHING
HELL

No wonder you finish your day completely drained while feeling you did nothing.

Killed by *Guillaume*

All (307)

2025 - 2025

Gaming

Platinum Trophy: Clair Obscur: Expedition 33

Killed after 14 days, the Expedition 33 Platinum Run was an obsessive attempt to 100% the game on release week. It was abandoned following an unskippable missable journal entry in Chapter 4 and three consecutive evenings spent failing parry timing on a optional boss. It was 2 weeks old.

2023 - 2024

Automation

MPG 03:59 AM Sniper Bot

Killed about 2 years ago, the Mon Petit Gazon automated bidding script reverse-engineered private mobile APIs to analyze opponent bankrolls and place optimal un-outbiddable €1 increments seconds before mercato rounds closed. Shut down when league admins realized every transfer went through at 03:59:58 AM. It was 6 months old.

2024 - 2024

Hardware

Local Living Room LLM ("Project Jarvis-Zero")

Killed over 2 years ago, Project Jarvis-Zero was an ambitious air-gapped private voice assistant running quantized Llama models locally on a clustered Raspberry Pi 5 setup. Discontinued after generating responses at 1.8 tokens/sec and the cooling fans waking up the dog every time someone asked to toggle the hallway lights. It was 3 months old.

2022 - 2022

Productivity

The Ultimate Notion "Life OS"

Killed 4 years ago, the Ultimate Life OS was a multi-relational database architecture mapping finances, daily hydration, book summaries, and 10-year goal frameworks with aesthetic minimalist banners. After taking 38 hours over Christmas break to design, it was logged into exactly four times before returning to Apple Notes. It was 17 days old.

2021 - 2022

Hardware

Hallway MagicMirror v2

Killed almost 4 years ago, MagicMirror v2 was a custom-built two-way acrylic glass smart mirror displaying real-time bus arrivals, Solisart solar yield, and calendar events. Killed when an OpenWeatherMap API key format change broke the weather widget and nobody wanted to take the 12kg frame off the drywall to plug in a keyboard. It was 18 months old.

2020 - 2020

Hardware

ESP32 Sourdough Fermentation Chamber

Killed almost 6 years ago, this lockdown hardware experiment paired a reptile heating pad, an ESP32, and a DHT22 sensor to maintain an 80% hydration sourdough starter at an optimal 26.5°C with Home Assistant telemetry. Killed after bakeries reopened and the starter died of starvation during a 3-day weekend. It was 2 months old.

What Do We Need to Take Back Control?

✗ WHAT DOES NOT WORK

- 90s latency breaking developer flow
- Reinventing the wheel on every prompt
- Micromanaging syntax line by line

✓ WHAT WE ACTUALLY NEED

- Sub-second speed > IQ
- Hybrid harnesses
- Continuous learning loop via skills
- Versioned & reviewable in Git

Stop babysitting amnesiacs: capture learnings into reviewable skills.

README.md

1. Communication Style

- **Direct & Highly Technical:** Prefers concise, factual, and direct explanations. Dislikes repetition of basic troubleshooting steps once verified.
- **Action-Oriented:** Focus on real tool execution over theoretical descriptions. Work autonomously to completion.
- **No Sycophancy & Candid Critical Thinking:** Never flatter or rubber-stamp proposals ("ne pas lécher les bottes ni trouver que tout est fantastique"). Be intellectually honest, critical, and a strong force of proposition (pointing out weaknesses, edge cases, or better alternatives), especially when specifically asked for an opinion.
- **Immediate Deference on Disagreement ("Giom is the Boss"):** If Giom says "tu as tort", "tu dis n'importe quoi", or expresses disagreement/gives a direct order, do NOT argue, debate, or justify. Obey immediately and execute — Giom always has the final call.

2. Working guidelines

- **Native Multimodal Audio:** Gemini accepts audio natively as input (along with video, images, etc.). Never transcribe audio files before passing them to Gemini or reasoning over them — feed audio directly to the model.
- **Git Worktrees:** Use git worktrees when developing features or updating skills to keep branches clean.
- **Safe Scratchpads:** Create temporary/test scripts in `/tmp/` rather than the project root.
- **Pull requests:**
 - Whenever you create a PR (Pull Request), make sure it's not failling any test or has merging issues, in which case fix them before asking me to review.
 - After the PR is merged, rebase the main branch and delete the PR's branch.
- **Systematic Jira Issue Tracking:**
 - For any discussion involving an action or implementation (excluding simple, one-off Q&A without deliverables), ensure a corresponding Jira issue exists.

THE NEW ECONOMICS OF CODE

Code Generation is Cheap. Human Review is the Bottleneck.

\$0.02

MAKE AGENTS WORK

PRICELESS

YOUR ATTENTION

An agent writes code in seconds: your review time is the real scarce resource.

WHERE THE INTERN ANALOGY BREAKS

WHERE THE INTERN ANALOGY BREAKS

START WITH REVIEWS

- An intern starts by coding
- Agent should first learn to review
- It will save you time (and sanity)
- An agent can't produce a good PR if it doesn't know how to evaluate it
- Tip: Use a different model for reviews

OPTIMIZE YOUR CODEBASE FOR REVIEWS

- We are taught to not duplicate code
- Agents don't care about doing repetitive work
- Feature-slices per feature to simplify review
- At glance you can see if something seems fishy
- Limited blast radius is something is broken

Your #1 priority is to be able to review efficiently

From Dumb Assertions to Autonomous Smoke Tests

AGENTS ARE NOT TESTING

- No logs
- Not checking PR status
- Only unit tests and compilation tests
- Apps crashing on launch
- Antigravity's test in browser are a nice try but not really usable

SMOKE TESTING AGENTS ARE THE FUTURE

- Running the app
- Testing the code flows
- Reviewing the UI/UX

SIMA 2

An agent that plays and reasons in virtual worlds
